

**Laravel**

**Edit & Update data**

To edit data in layout members, we need to add an edit button in the members.blade.php layout.

```
<div class="card mb-1">
  <div class="card-body">
    <p><strong>Name: {{ $information->name }}</strong></p>
    <p>Hobby: {{ $information->hobby }}</p>
    <a href="/members/{{ $information->id }}/edit" class="btn btn-primary">Edit</a>
  </div>
</div>
```

## This is a sozolab members page

Add new member +

**Name:** Christina

Hobby: gardening

Edit

**Name:** Defry

Hobby: badminton

Edit

**Name:** Fikry

Hobby: football

Edit

< 1 2 >

We make a scenario when user press edit button, the system will move from layout members to members/edit. So, we add route in web.php

```
Route::get('/members', 'MemberController@index');
Route::get('/members/create', 'MemberController@create');
Route::get('/members/{slug}', 'MemberController@show');
Route::post('/members', 'MemberController@store');
Route::get('/members/{id}/edit', 'MemberController@edit');
```

Now it's time for us to create a new layout named: edit.blade.php in folder view/members. Because of edit.blade.php is similar with create.blade.php, we can duplicate it and modification.

```
<div class="form-group">
    <label for="name">Name</label>
    <input type="text" class="form-control" id="name" name="name"
    value="{{old('name') ? old('name') : $members->name}}">
</div>
<br>
<div class="form-group">
    <label for="hobby">Hobbies</label>
    <textarea class="form-control" id="hobby" name="hobby" rows="3" value="">
    {{old('hobby') ? old('hobby') : $members->hobby}}</textarea>
</div>
```

## Edit member

Name

Tan

Hobbies

swimming

Save

**The next task is to send the edited data to the  
laravel-sozolab database**

**Next...**

Let's create a new route to update the data with the command "put" in web.php

```
Route::put('/members/{id}', 'MemberController@update');
```

Then we will create an update function in MemberController.php

```
public function update(Request $request, $id)
{
    $member = Member::find($id);
    $member->name = $request->name;
    $member->hobby = $request->hobby;
    $member->save();

    return redirect('/members');
}
```

Don't forget, we also have to add a little coding in the view/members/edit with:

```
<form action="/members/{members->id}" method="post">
    @csrf
    @method('PUT')
```

## Edit member

Name

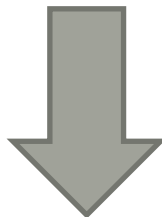

Tan

Hobbies

table tennis

Save

**Name: Tan**

Hobby: table tennis

Edit

Thank you 😊
